# 1 Introduction

CeTZ-Plot is a simple plotting library for use with CeTZ.

# 2 Usage

This is the minimal starting point:

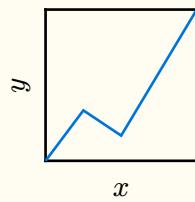

```
#import "@preview/cetz:0.3.2"
#import "@preview/cetz-plot:0.1.1"
#cetz.canvas({
    import cetz.draw: *
    import cetz-plot: *
    ...
})
```

Note that plot functions are imported inside the scope of the canvas block. All following example code is expected to be inside a canvas block, with the `plot` module imported into the namespace.

# 3 Plot

## 3.0.1 plot

Create a plot environment. Data to be plotted is given by passing it to the `plot.add` or other plotting functions. The plot environment supports different axis styles to draw, see its parameter `axis-style`:

```
plot.plot(size: (2,2), x-tick-step: none, y-tick-step: none, {
    plot.add(((0,0), (1,1), (2,.5), (4,3)))
})
```

To draw elements inside a plot, using the plots coordinate system, use the `plot.annotate(..)` function.

# 4 parameters

# 5 Options

You can use the following options to customize each axis of the plot. You must pass them as named arguments prefixed by the axis name followed by a dash (-) they should target. Example: `x-min: 0`, `y-ticks: (...)` or `x2-label: [...]`.

**label:** `none` or `content` Default: "none"

The axis' label. If and where the label is drawn depends on the `axis-style`.

**min:** `auto` or `float` Default: "auto"

Axis lower domain value. If this is set greater than than `max`, the axis' direction is swapped

**max:** `auto` or `float` Default: "auto"

Axis upper domain value. If this is set to a lower value than `min`, the axis' direction is swapped

**equal:** `string` Default: "none"

Set the axis domain to keep a fixed aspect ratio by multiplying the other axis domain by the plots aspect ratio, depending on the other axis orientation (see `horizontal`). This can be useful to force one axis to grow or shrink with another one. You can only "lock" two axes of different orientations.

```
plot.plot(size: (2,1), x-tick-step: 1, y-tick-step: 1,
          x-equal: "y",
          {
            plot.add(domain: (0, 2 * calc.pi),
                      t => (calc.cos(t), calc.sin(t)))
          })
}
```

**horizontal:** bool

Default: "axis name dependant"

If true, the axis is considered an axis that gets drawn horizontally, vertically otherwise. The default value depends on the axis name on axis creation. Axes which name start with x have this set to true, all others have it set to false. Each plot has to use one horizontal and one vertical axis for plotting, a combination of two y-axes will panic: ("y", "y2").

**tick-step:** none or auto or float

Default: "auto"

The increment between tick marks on the axis. If set to auto, an increment is determined. When set to none, incrementing tick marks are disabled.

**minor-tick-step:** none or float

Default: "none"

Like tick-step, but for minor tick marks. In contrast to ticks, minor ticks do not have labels.

**ticks:** none or array

Default: "none"

A List of custom tick marks to additionally draw along the axis. They can be passed as an array of <float> values or an array of (<float>, <content>) tuples for setting custom tick mark labels per mark.

```
plot.plot(x-tick-step: none, y-tick-step: none,
          x-min: 0, x-max: 4,
          x-ticks: (1, 2, 3),
          y-min: 1, y-max: 2,
          y-ticks: ((1, [One]), (2, [Two])),
          {
            plot.add(((0,0),))
          })
}
```

Examples: (1, 2, 3) or ((1, [One]), (2, [Two]), (3, [Three]))

**format:** none or string or function

Default: "float"

How to format the tick label: You can give a function that takes a <float> and return <content> to use as the tick label. You can also give one of the predefined options:

**float** Floating point formatting rounded to two digits after the point (see decimals)

**sci** Scientific formatting with  $\times 10^n$  used as exponent syntax

```
let formatter(v) = if v != 0 {${#v/calc.pi} pi ${} else ${0 ${}
plot.plot(x-tick-step: calc.pi, y-tick-step: none,
          x-min: 0, x-max: 2 * calc.pi,
          x-format: formatter,
          {
            plot.add(((0,0),))
          })
}
```

**decimals:** int

Default: "2"

Number of decimals digits to display for tick labels, if the format is set to "float".

**mode:** `none` or `string`Default: `"none"`

The scaling function of the axis. Takes `lin` (default) for linear scaling, and `log` for logarithmic scaling.

**base:** `none` or `number`Default: `"none"`

The base to be used when labeling axis ticks in logarithmic scaling

**grid:** `bool` or `string`Default: `"false"`

If `true` or `"major"`, show grid lines for all major ticks. If set to `"minor"`, show grid lines for minor ticks only. The value `"both"` enables grid lines for both, major- and minor ticks.

```
plot.plot(x-tick-step: 1, y-tick-step: 1,
          y-minor-tick-step: .2,
          x-min: 0, x-max: 2, x-grid: true,
          y-min: 0, y-max: 2, y-grid: "both", {
            plot.add(((0,0),))
          })
```

**break:** `bool`Default: `"false"`

If true, add a “sawtooth” at the start or end of the axis line, depending on the axis bounds. If the axis min. value is  $> 0$ , a sawtooth is added to the start of the axes, if the axis max. value is  $< 0$ , a sawtooth is added to its end.

## Parameters

```
plot(
  body: body,
  size: array,
  axis-style: none string,
  name: string,
  plot-style: style function,
  mark-style: style function,
  fill-below: bool,
  legend: none auto coordinate,
  legend-anchor: auto string,
  legend-style: style,
  ..options: any
)
```

**body** `body`

Calls of `plot.add` or `plot.add-*` commands. Note that normal drawing commands like `line` or `rect` are not allowed inside the plots body, instead wrap them in `plot.annotate`, which lets you select the axes used for drawing.

**size** `array`

Plot size tuple of (`<width>`, `<height>`) in canvas units. This is the plots inner plotting size without axes and labels.

Default: `(1, 1)`

**axis-style** `none` or `string`

How the axes should be styled:

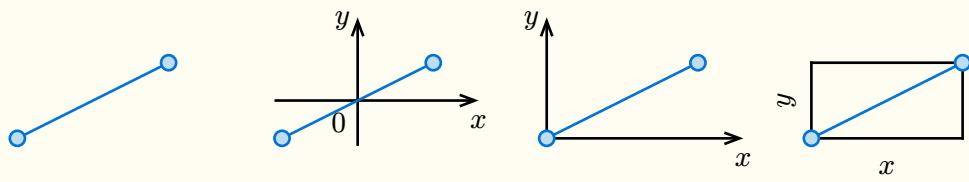

**scientific** Frames plot area using a rectangle and draw axes `x` (bottom), `y` (left), `x2` (top), and `y2` (right) around it. If `x2` or `y2` are unset, they mirror their opposing axis.

**scientific-auto** Draw set (used) axes `x` (bottom), `y` (left), `x2` (top) and `y2` (right) around the plotting area, forming a rect if all axes are in use or a L-shape if only `x` and `y` are in use.

**school-book** Draw axes `x` (horizontal) and `y` (vertical) as arrows pointing to the right/top with both crossing at  $(0, 0)$

**left** Draw axes `x` and `y` as arrows, while the `y` axis stays on the left (at `y.min`) and the `x` axis at the bottom (at `y.min`)

**none** Draw no axes (and no ticks).

```
let opts = (x-tick-step: none, y-tick-step: none, size: (2,1))
let data = plot.add((-1,-1), (1,1), mark: "o")

for name in (none, "school-book", "left", "scientific") {
  plot.plot(axis-style: name, ..opts, data, name: "plot")
  content((0,-1), "-|", "plot.south"), repr(name))
  set-origin((3.5,0))
}
```

Default: `"scientific"`

**name** `string`

The plots element name to be used when referring to anchors

Default: `none`

**plot-style** `style` or `function`

Styling to use for drawing plot graphs. This style gets inherited by all plots and supports palette functions. The following style keys are supported:

**stroke:** `none` or `stroke`

Default: `1pt`

Stroke style to use for stroking the graph.

**fill:** `none` or `paint`

Default: `none`

Paint to use for filled graphs. Note that not all graphs may support filling and that you may have to enable filling per graph, see `plot.add(fill: ...)`.

Default: `default-plot-style`

**mark-style** style or function

Styling to use for drawing plot marks. This style gets inherited by all plots and supports palette functions. The following style keys are supported:

**stroke:** none or stroke

Default: 1pt

Stroke style to use for stroking the mark.

**fill:** none or paint

Default: none

Paint to use for filling marks.

Default: default-mark-style

**fill-below** bool

If true, the filled shape of plots is drawn *below* axes.

Default: true

**legend** none or auto or coordinate

The position the legend will be drawn at. See plot-legends for information about legends. If set to <auto>, the legend's "default-placement" styling will be used. If set to a <coordinate>, it will be taken as relative to the plot's origin.

Default: auto

**legend-anchor** auto or string

Anchor of the legend group to use as its origin. If set to auto and legend is one of the predefined legend anchors, the opposite anchor to legend gets used.

Default: auto

**legend-style** style

Style key-value overwrites for the legend style with style root legend.

Default: (:)

**..options** any

Axis options, see *options* below.

**5.0.1 add-anchor**

Add an anchor to a plot environment

This function is similar to `draw.anchor` but it takes an additional axis tuple to specify which axis coordinate system to use.

```

plot.plot(size: (2,2), name: "plot",
          x-tick-step: none, y-tick-step: none, {
    plot.add(((0,0), (1,1), (2,.5), (4,3)))
    plot.add-anchor("pt", (1,1))
  })
line("plot.pt", ((0,0), (0,1.5)), mark: (start: ">"), name: "line")
content("line.end", [Here], anchor: "south", padding: .1)

```

## Parameters

### add-anchor(

**name** string  
**position** tuple  
**axes** tuple

)

#### **name** string

Anchor name

#### **position** tuple

Tuple of x and y values. Both values can have the special values “min” and “max”, which resolve to the axis min/max value. Position is in axis space defined by the axes passed to axes.

#### **axes** tuple

Name of the axes to use ("x", "y") as coordinate system for position. Note that both axes must be used, as add-anchors does not create them on demand.

Default: ("x", "y")

## 5.0.2 add

Add data to a plot environment.

Note: You can use this for scatter plots by setting the stroke style to none: add(..., style: (stroke: none)).

Must be called from the body of a `plot(..)` command.

**Parameters**

```
add(
    domain: domain,
    hypograph: bool,
    epigraph: bool,
    fill: bool,
    fill-type: string,
    style: style,
    mark: string,
    mark-size: float,
    mark-style,
    samples: int,
    sample-at: array,
    line: string dictionary,
    axes: axes,
    label: none content,
    data: array function
)
```

**domain** domain

Domain of data, if data is a function. Has no effect if data is not a function.

Default: `auto`

**hypograph** bool

Fill hypograph; uses the `hypograph` style key for drawing

Default: `false`

**epigraph** bool

Fill epigraph; uses the `epigraph` style key for drawing

Default: `false`

**fill** bool

Fill the shape of the plot

Default: `false`

**fill-type** string

Fill type:

`"axis"` Fill the shape to  $y = 0$

`"shape"` Fill the complete shape

Default: `"axis"`

**style** style

Style to use, can be used with a palette function

Default: ( : )

**mark** string

Mark symbol to place at each distinct value of the graph. Uses the `mark` style key of `style` for drawing.

Default: none

**mark-size** float

Mark size in canvas units

Default: .2

**samples** int

Number of times the `data` function gets called for sampling y-values. Only used if `data` is of type function. This parameter gets passed onto `sample-fn`.

Default: 50

**sample-at** array

Array of x-values the function gets sampled at in addition to the default sampling. This parameter gets passed to `sample-fn`.

Default: ()

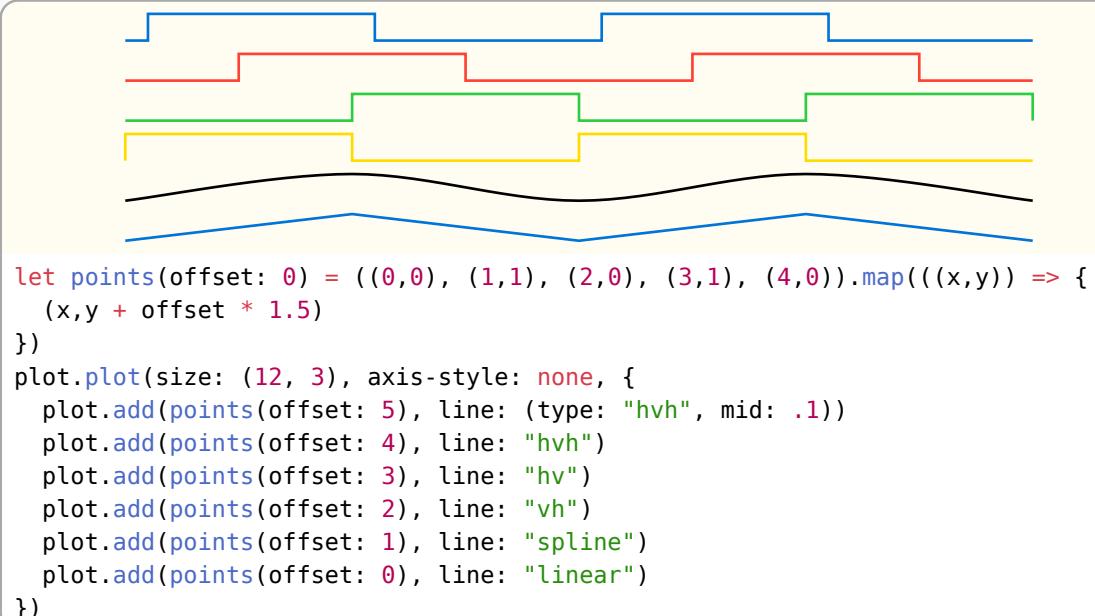

**line** string or dictionary

Line type to use. The following types are supported:

- "raw"** Plot raw data
- "linear"** Linearize data
- "spline"** Calculate a Catmull-Rom curve through all points
- "vh"** Move vertical and then horizontal
- "hv"** Move horizontal and then vertical
- "hvh"** Add a vertical step in the middle

If the value is a dictionary, the type must be supplied via the `type` key. The following extra attributes are supported:

- "samples" <int>** Samples of splines
- "tension" <float>** Tension of splines
- "mid" <float>** Mid-Point of hvh lines (0 to 1)
- "epsilon" <float>** Linearization slope epsilon for use with "linear", defaults to 0.

Default: "raw"

**axes** axes

Name of the axes to use for plotting. Reversing the axes means rotating the plot by 90 degrees.

Default: ("x", "y")

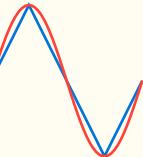

**label** none or content

Legend label to show for this plot.

Default: `none`

**data** array or function

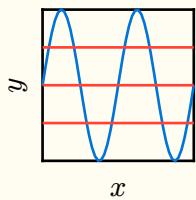

Array of 2D data points (numeric) or a function of the form  $x \Rightarrow y$ , where  $x$  is a value in domain and  $y$  must be numeric or a 2D vector (for parametric functions).

```
plot.plot(size: (2, 2), axis-style: none, {
    // Using an array of points:
    plot.add(((0,0), (calc.pi/2,1),
              (1.5*calc.pi,-1), (2*calc.pi,0)))
    // Sampling a function:
    plot.add(domain: (0, 2*calc.pi), calc.sin)
})
```

**5.0.3 add-hline**

Add horizontal lines at one or more  $y$ -values. Every lines start and end points are at their axis bounds.

```
plot.plot(size: (2,2), x-tick-step: none, y-tick-step: none, {
    plot.add(domain: (0, 4*calc.pi), calc.sin)
    // Add 3 horizontal lines
    plot.add-hline(-.5, 0, .5)
})
```

**Parameters**

```
add-hline(
    ..y: float,
    min: auto float,
    max: auto float,
    axes: array,
    style: style,
    label: none content
)
```

**..y** float

Y axis value(s) to add a line at

**min** auto or float

X axis minimum value or auto to take the axis minimum

Default: auto

**max** auto or float

X axis maximum value or auto to take the axis maximum

Default: auto

**axes** array

Name of the axes to use for plotting

Default: ("x", "y")

**style** style

Style to use, can be used with a palette function

Default: (:)

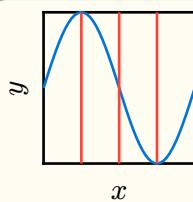

**label** none or content

Legend label to show for this plot.

Default: none

## 5.0.4 add-vline

Add vertical lines at one or more x-values. Every lines start and end points are at their axis bounds.

```
plot.plot(size: (2,2), x-tick-step: none, y-tick-step: none, {
    plot.add(domain: (0, 2*calc.pi), calc.sin)
    // Add 3 vertical lines
    plot.add-vline(calc.pi/2, calc.pi, 3*calc.pi/2)
})
```

**Parameters**

```
add-vline(
    ..x: float,
    min: auto float,
    max: auto float,
    axes: array,
    style: style,
    label: none content
)
```

**..x** float

X axis values to add a line at

**min** auto or float

Y axis minimum value or auto to take the axis minimum

Default: auto

**max** auto or float

Y axis maximum value or auto to take the axis maximum

Default: auto

**axes** array

Name of the axes to use for plotting, note that not all plot styles are able to display a custom axis!

Default: ("x", "y")

**style** style

Style to use, can be used with a palette function

Default: (:)

**label** none or content

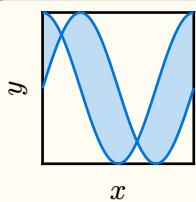

Legend label to show for this plot.

Default: none

## 5.0.5 add-fill-between

Fill the area between two graphs. This behaves same as `add` but takes a pair of data instead of a single data array/function. The area between both function plots gets filled. For a more detailed explanation of the arguments, see [add\(\)](#).

This can be used to display an error-band of a function.

```
plot.plot(size: (2,2), x-tick-step: none, y-tick-step: none, {
    plot.add-fill-between(domain: (0, 2*calc.pi),
        calc.sin, // First function/data
        calc.cos) // Second function/data
})
```

### Parameters

```
add-fill-between(
    data-a: array function,
    data-b: array function,
    domain: domain,
    samples: int,
    sample-at: array,
    line: string dictionary,
    axes: array,
    label: none content,
    style: style
)
```

**data-a** array or function

Data of the first plot, see [add\(\)](#).

**data-b** array or function

Data of the second plot, see [add\(\)](#).

**domain** domain

Domain of both data-a and data-b. The domain is used for sampling functions only and has no effect on data arrays.

Default: `auto`

**samples** int

Number of times the data-a and data-b function gets called for sampling y-values. Only used if data-a or data-b is of type function.

Default: `50`

**sample-at** array

Array of x-values the function(s) get sampled at in addition to the default sampling.

Default: `()`

**line** string or dictionary

Line type to use, see [add\(\)](#).

Default: `"raw"`

**axes** array

Name of the axes to use for plotting.

Default: `("x", "y")`

**label** none or content

Legend label to show for this plot.

Default: `none`

**style style**

Style to use, can be used with a palette function.

Default: ( : )

**5.0.6 add-bar**

Add a bar- or column-chart to the plot

A bar- or column-chart is a chart where values are drawn as rectangular boxes.

**Parameters**

```
add-bar(
    data: array ,
    x-key,
    y-key,
    error-key,
    mode: string ,
    labels: none content array ,
    bar-width: float ,
    bar-position: string ,
    cluster-gap: float ,
    whisker-size,
    error-style,
    style: dictionary ,
    axes: axes
)
```

**data array**

Array of data items. An item is an array containing a x an one or more y values. For example (0, 1) or (0, 10, 5, 30). Depending on the mode, the data items get drawn as either clustered or stacked rects.

- x-key: (int,string): Key to use for retrieving a bars x-value from a single data entry. This value gets passed to the .at(...) function of a data item.
- y-key: (auto,int,string,array): Key to use for retrieving a bars y-value. For clustered/stacked data, this must be set to a list of keys (e.g. range(1, 4)). If set to auto, att but the first array-values of a data item are used as y-values.
- error-key: (none,int,string,array): Key(s) to use for retrieving a bars y-error.

**mode** string

The mode on how to group data items into bars:

**basic** Add one bar per data value. If the data contains multiple values, group those bars next to each other.

**clustered** Like “basic”, but take into account the maximum number of values of all items and group each cluster of bars together having the width of the widest cluster.

**stacked** Stack bars of subsequent item values onto the previous bar, generating bars with the height of the sum of all an items values.

**stacked100** Like “stacked”, but scale each bar to height 100, making the different bars percentages of the sum of an items values.

Default: "basic"

**labels** none or content or array

A single legend label for “basic” bar-charts, or a list of legend labels per bar category, if the mode is one of “clustered”, “stacked” or “stacked100”.

Default: none

**bar-width** float

Width of one data item on the y axis

Default: 1

**bar-position** string

Positioning of data items relative to their x value.

- “start”: The lower edge of the data item is on the x value (left aligned)
- “center”: The data item is centered on the x value
- “end”: The upper edge of the data item is on the x value (right aligned)

Default: "center"

**cluster-gap** float

Spacing between bars insides a cluster.

Default: 0

**style** dictionary

Plot style

Default: ( : )

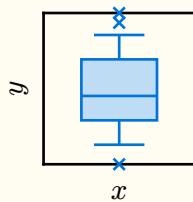

**axes**    **axes**

Plot axes. To draw a horizontal growing bar chart, you can swap the x and y axes.

Default: ("x", "y")

**5.0.7 add-boxwhisker**

Add one or more box or whisker plots

```
plot.plot(size: (2,2), x-tick-step: none, y-tick-step: none, {
    plot.add-boxwhisker((x: 1, // Location on x-axis
        outliers: (7, 65, 69), // Optional outlier values
        min: 15, max: 60, // Minimum and maximum
        q1: 25, // Quartiles: Lower
        q2: 35, // Median
        q3: 50)) // Upper
})
```

**Parameters**

```
add-boxwhisker(
    data: array dictionary,
    label: none content,
    axes: array,
    style: style,
    box-width: float,
    whisker-width: float,
    mark: string,
    mark-size: float
)
```

**data**    **array** or **dictionary**

dictionary or array of dictionaries containing the needed entries to plot box and whisker plot.

The following fields are supported:

- **x** (number) X-axis value
- **min** (number) Minimum value
- **max** (number) Maximum value
- **q1, q2, q3** (number) Quartiles from lower to upper
- **outliers** (array of number) Optional outliers

**label**    **none** or **content**

Legend label to show for this plot.

Default: **none**

**axes**    **array**

Name of the axes to use ("x", "y"), note that not all plot styles are able to display a custom axis!

Default: ("x", "y")

**style** `style`

Style to use, can be used with a palette function

Default: `(:)`

**box-width** `float`

Width from edge-to-edge of the box of the box and whisker in plot units. Defaults to 0.75

Default: `0.75`

**whisker-width** `float`

Width from edge-to-edge of the whisker of the box and whisker in plot units. Defaults to 0.5

Default: `0.5`

**mark** `string`

Mark to use for plotting outliers. Set `none` to disable. Defaults to "x"

Default: `"*"`

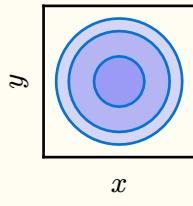

**mark-size** `float`

Size of marks for plotting outliers. Defaults to 0.15

Default: `0.15`

## 5.0.8 add-contour

Add a contour plot of a sampled function or a matrix.

```
plot.plot(size: (2,2), x-tick-step: none, y-tick-step: none, {
  plot.add-contour(x-domain: (-3, 3), y-domain: (-3, 3),
    style: (fill: rgb(50,50,250,50)),
    fill: true,
    op: "<",           // Find contours where data < z
    z: (2.5, 2, 1),   // Z values to find contours for
    (x, y) => calc.sqrt(x * x + y * y))
})
```

**Parameters**

```
add-contour(
    data: array or function ,
    label: none or content ,
    z: float or array ,
    x-domain: domain ,
    y-domain: domain ,
    x-samples: int ,
    y-samples: int ,
    interpolate: bool ,
    op: auto or string or function ,
    axes: axes ,
    style: style ,
    fill: bool ,
    limit: int
)
```

**data**    array or function

A function of the signature  $(x, y) \Rightarrow z$  or an array of arrays of floats (a matrix) where the first index is the row and the second index is the column.

**label**    none or content

Plot legend label to show. The legend preview for contour plots is a little rectangle drawn with the contours style.

Default: none

**z**    float or array

Z values to plot. Contours containing values above z ( $z \geq 0$ ) or below z ( $z < 0$ ) get plotted. If you specify multiple z values, they get plotted in the order of specification.

Default: (1,)

**x-domain**    domain

X axis domain used if data is a function, that is the domain inside the function gets sampled.

Default: (0, 1)

**y-domain**    domain

Y axis domain used if data is a function, see x-domain.

Default: (0, 1)

**x-samples** int

X axis domain samples ( $2 < n$ ). Note that contour finding can be quite slow. Using a big sample count can improve accuracy but can also lead to bad compilation performance.

Default: 25

**y-samples** int

Y axis domain samples ( $2 < n$ )

Default: 25

**interpolate** bool

Use linear interpolation between sample values which can improve the resulting plot, especially if the contours are curved.

Default: true

**op** auto or string or function

Z value comparison operator:

">", ">=", "<", "<=", "!=" , "==" Use the operator for comparison of z to the values from data.

**auto** Use ">=" for positive z values, "<=" for negative z values.

**<function>** Call comparison function of the format (plot-z, data-z) => boolean, where plot-z is the z-value from the plots z argument and data-z is the z-value of the data getting plotted. The function must return true if at the combinations of arguments a contour is detected.

Default: auto

**axes** axes

Name of the axes to use for plotting.

Default: ("x", "y")

**style** style

Style to use for plotting, can be used with a palette function. Note that all z-levels use the same style!

Default: ( : )

**fill** bool

Fill each contour

Default: false

**limit** int

Limit of contours to create per z value before the function panics

Default: 50

**5.0.9 add-errorbar**

Add x- and/or y-error bars

**Parameters**

```
add-errorbar(
    pt: tuple,
    x-error,
    y-error,
    label,
    mark,
    mark-size,
    mark-style,
    whisker-size: float,
    style: dictionary,
    axes: axes
)
```

**pt** tuple

Error-bar center coordinate tuple: (x, y)

- x-error: (float,tuple): Single error or tuple of errors along the x-axis
- y-error: (float,tuple): Single error or tuple of errors along the y-axis
- mark: (none,string): Mark symbol to show at the error position (pt).
- mark-size: (number): Size of the mark symbol.
- mark-style: (style): Extra style to apply to the mark symbol.

**whisker-size** float

Width of the error bar whiskers in canvas units.

Default: .5

**style** dictionary

Style for the error bars

- label: (none,content): Label to tsh

Default: (:)

**axes** axes

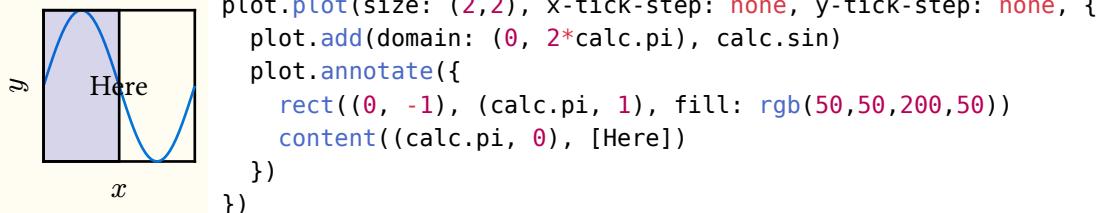

Plot axes. To draw a horizontal growing bar chart, you can swap the x and y axes.

Default: ("x", "y")

### 5.0.10 annotate

Add an annotation to the plot

An annotation is a sub-canvas that uses the plots coordinates specified by its x and y axis.

Bounds calculation is done naively, therefore fixed size content *can* grow out of the plot. You can adjust the padding manually to adjust for that. The feature of solving the correct bounds for fixed size elements might be added in the future.

#### Parameters

```
annotate(
    body: drawable,
    axes: axes,
    resize: bool,
    padding: none number dictionary,
    background: bool
)
```

**body**    `drawable`

Elements to draw

**axes**    `axes`

X and Y axis names

Default: ("x", "y")

**resize**    `bool`

If true, the plots axes get adjusted to contain the annotation

Default: `true`

**padding**    `none` or `number` or `dictionary`

Annotation padding that is used for axis adjustment

Default: `none`

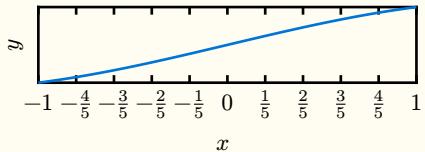

**background** bool

If true, the annotation is drawn behind all plots, in the background. If false, the annotation is drawn above all plots.

Default: `false`

## 5.0.11 fraction

Fraction tick formatter

```
plot.plot(size: (5,1),
          x-format: plot.formats.fraction,
          x-tick-step: 1/5,
          y-tick-step: none, {
    plot.add(calc.sin, domain: (-1, 1))
})
```

### Parameters

```
fraction(
    value: number,
    denom: auto int,
    eps: number
) -> Content if a matching fraction could be found or none
```

**value** number

Value to format

**denom** auto or int

Denominator for result fractions. If set to auto, a hardcoded fraction table is used for finding fractions with a denominator <= 11.

Default: `auto`

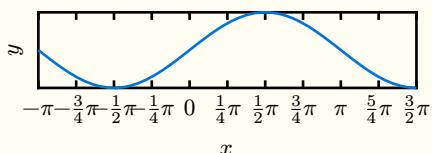

**eps** number

Epsilon used for comparison

Default: `1e-6`

## 5.0.12 multiple-of

Multiple of tick formatter

```
plot.plot(size: (5,1),
          x-format: plot.formats.multiple-of,
          x-tick-step: calc.pi/4,
          y-tick-step: none, {
    plot.add(calc.sin, domain: (-calc.pi, 1.5 * calc.pi))
})
```

## Parameters

```
multiple-of(  
    value: number,  
    factor: number,  
    symbol: content,  
    fraction: none true int,  
    digits: int,  
    eps: number,  
    prefix: content,  
    suffix: content  
) -> Content if a matching fraction could be found or none
```

**value** number

Value to format

**factor** number

Factor value is expected to be a multiple of.

Default: calc.pi

**symbol** content

Suffix symbol. For value = 0, the symbol is not appended.

Default: \$pi\$

**fraction** none or true or int

If not none, try finding matching fractions using the same mechanism as fraction. If set to an integer, that integer is used as denominator. If set to none or false, or if no fraction could be found, a real number with digits digits is used.

Default: true

**digits** int

Number of digits to use for rounding

Default: 2

**eps** number

Epsilon used for comparison

Default: 1e-6

**prefix** `content`

Content to prefix

Default: []

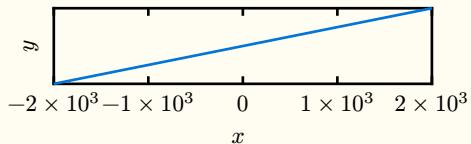

**suffix** `content`

Content to append

Default: []

### 5.0.13 sci

Scientific notation tick formatter

```
plot.plot(size: (5,1),
          x-format: plot.formats.sci,
          x-tick-step: 1e3,
          y-tick-step: none, {
            plot.add(x => x, domain: (-2e3, 2e3))
          })
```

#### Parameters

```
sci(
  value: number,
  digits: int,
  prefix: content,
  suffix: content
) -> Content
```

**value** `number`

Value to format

**digits** `int`

Number of digits for rounding the factor

Default: 2

**prefix** `content`

Content to prefix

Default: []

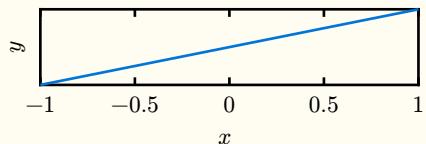

**suffix** `content`

Content to append

Default: []

## 5.0.14 decimal

Rounded decimal number formatter

```
plot.plot(size: (5,1),
          x-format: plot.formats.decimal,
          x-tick-step: .5,
          y-tick-step: none, {
            plot.add(x => x, domain: (-1, 1))
          })
```

### Parameters

```
decimal(
  value: number,
  digits: int,
  prefix: content,
  suffix: content
) -> Content
```

**value** `number`

Value to format

**digits** `int`

Number of digits to round to

Default: 2

**prefix** `content`

Content to prefix

Default: []

**suffix** `content`

Content to append

Default: []

## 5.0.15 add-violin

Add a violin plot

A violin plot is a chart that can be used to compare the distribution of continuous data between categories.

**Parameters**

```
add-violin(
    data: array,
    x-key: int or string,
    y-key: int or string,
    side: string,
    kernel: function,
    bandwidth: float,
    extents: float,
    samples: int,
    style: dictionary,
    mark-style: dictionary,
    axes: axes,
    label: none or content
)
```

**data** array

Array of data items. An item is an array containing an x and one or more y values.

**x-key** int or string

Key to use for retrieving the x position of the violin.

Default: 0

**y-key** int or string

Key to use for retrieving values of points within the category.

Default: 1

**side** string

The sides of the violin to be rendered:

**left** Plot only the left side of the violin.

**right** Plot only the right side of the violin.

**both** Plot both sides of the violin.

Default: "right"

**kernel** function

The kernel density estimator function, which takes a single x value relative to the center of a distribution (0) and normalized by the bandwidth

Default: kernel-normal.with(stdev: 1.5)

**bandwidth** float

The smoothing parameter of the kernel.

Default: 1

**extents** float

The extension of the domain, expressed as a fraction of spread.

Default: 0.25

**samples** int

The number of samples of the kernel to render.

Default: 50

**style** dictionary

Style override dictionary.

Default: ( : )

**mark-style** dictionary

(unused, will eventually be used to render interquartile ranges).

Default: ( : )

**axes** axes

(unstable, documentation to follow once completed).

Default: ("x", "y")

**label** none or content

The name of the category to be shown in the legend.

Default: none

**5.0.16 item**

Construct a legend item for use with the legend function

**Parameters**

```
item(
  label: none auto content,
  preview: auto function,
  mark,
  mark-style,
  mark-size,
  ..style: styles
)
```

**label**    none or auto or content

Legend label or auto to use the enumerated default label

**preview**    auto or function

Legend preview icon function of the format item => elements. Note that the canvas bounds for drawing the preview are (0,0) to (1,1).

- mark: (none,string): Legend mark symbol
- mark-style: (none,dictionary): Mark style
- mark-size: (number): Mark size

**..style**    styles

Style keys for the single item

**5.0.17 legend**

Draw a legend

**Parameters**

```
legend(
  position,
  items,
  name,
  ..style
)
```

**5.0.18 add-legend**

Function for manually adding a legend item from within a plot environment

**Parameters**

```
add-legend(
  label: content,
  preview: auto function
)
```

**label** `content`

Legend label

**preview** `auto` or `function`

Legend preview function of the format () => elements. The preview canvas bounds are between (0,0) and (1,1). If set to auto, a straight line is drawn.

```
plot.plot(size: (1,1), x-tick-step: none, y-tick-step: none, {
  plot.add(((0,0), (1,1))) // Some data
  plot.add-legend([Custom item], preview: () => {
    import cetz.draw: *
    circle((.5,.5), radius: .5) // Draw a custom preview
    // between (0,0) and (1,1)
  })
  plot.add-legend([Another item])
})
```

Default: `auto`

## 5.1 Styling

You can use style root axes with the following keys:

### 5.1.1 default-style

Default axis style

**tick-limit:** `int`

Default: `100`

Upper major tick limit.

**minor-tick-limit:** `int`

Default: `1000`

Upper minor tick limit.

**auto-tick-factors:** `array`

Default: `none`

List of tick factors used for automatic tick step determination.

**auto-tick-count:** `int`

Default: `none`

Number of ticks to generate by default.

**stroke:** `stroke`

Default: `none`

Axis stroke style.

**label.offset:** `number`

Default: `none`

Distance to move axis labels away from the axis.

**label.anchor:** `anchor`

Default: `none`

Anchor of the axis label to use for it's placement.

**label.angle:** `angle`

Default: `none`

Angle of the axis label.

**axis-layer:** `float`

Default: `none`

Layer to draw axes on (see cetz' on-layer)

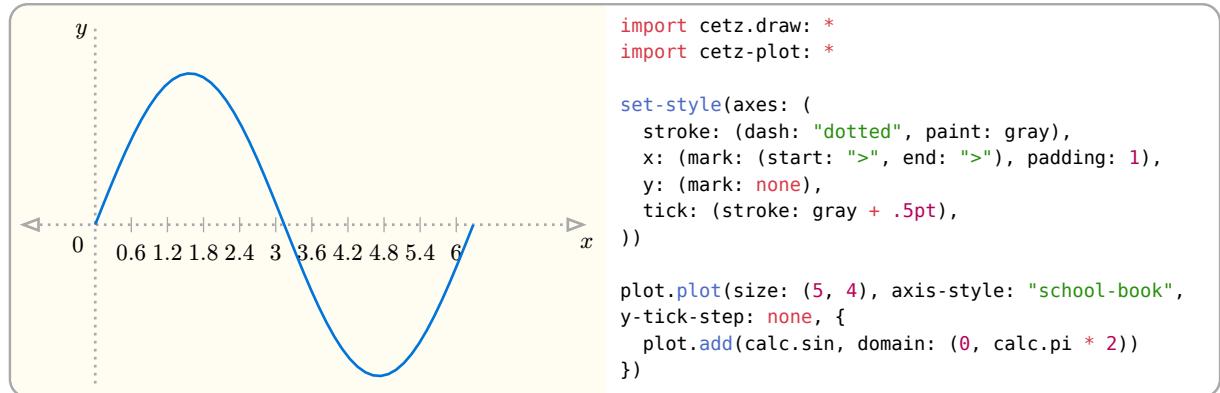

<b>grid-layer:</b> float	Default: none
Layer to draw the grid on (see cetz' on-layer)	
<b>background-layer:</b> float	Default: none
Layer to draw the background on (see cetz' on-layer)	
<b>padding:</b> number	Default: none
Extra distance between axes and plotting area. For schoolbook axes, this is the length of how much axes grow out of the plotting area.	
<b>overshoot:</b> number	Default: none
School-book style axes only: Extra length to add to the end (right, top) of axes.	
<b>tick.stroke:</b> stroke	Default: none
Major tick stroke style.	
<b>tick.minor-stroke:</b> stroke	Default: none
Minor tick stroke style.	
<b>tick.offset:</b> number or ratio	Default: none
Major tick offset along the tick's direction, can be relative to the length.	
<b>tick.minor-offset:</b> number or ratio	Default: none
Minor tick offset along the tick's direction, can be relative to the length.	
<b>tick.length:</b> number	Default: none
Major tick length.	
<b>tick.minor-length:</b> number or ratio	Default: none
Minor tick length, can be relative to the major tick length.	
<b>tick.label.offset:</b> number	Default: none
Major tick label offset away from the tick.	
<b>tick.label.angle:</b> angle	Default: none
Major tick label angle.	
<b>tick.label.anchor:</b> anchor	Default: none
Anchor of major tick labels used for positioning.	
<b>tick.label.show:</b> auto or bool	Default: auto
Set visibility of tick labels. A value of auto shows tick labels for all but mirrored axes.	
<b>grid.stroke:</b> stroke	Default: none
Major grid line stroke style.	
<b>break-point.width:</b> number	Default: none
Axis break width along the axis.	
<b>break-point.length:</b> number	Default: none
Axis break length.	
<b>minor-grid.stroke:</b> stroke	Default: none
Minor grid line stroke style.	

**shared-zero:** bool or content

Default: "\$0\$"

School-book style axes only: Content to display at the plots origin (0,0). If set to false, nothing is shown. Having this set, suppresses auto-generated ticks for 0!

### 5.1.2 Example

## 6 Chart

### 6.0.1 barchart

Draw a bar chart. A bar chart is a chart that represents data with rectangular bars that grow from left to right, proportional to the values they represent.

## 7 Styling

Can be applied with `cetz.draw.set-style(barchart: (bar-width: 1))`.

**Root:** barchart.

**bar-width:** float

Default: 0.8

Width of a single bar (basic) or a cluster of bars (clustered) in the plot.

**y-inset:** float

Default: 1

Distance of the plot data to the plot's edges on the y-axis of the plot.

**cluster-gap:** float

Default: 0

Spacing between bars insides a cluster.

You can use any `plot` or `axes` related style keys, too.

The `barchart` function is a wrapper of the `plot` API. Arguments passed to `..plot-args` are passed to the `plot.plot` function.

## Parameters

```
barchart(
    data: array,
    label-key: int or string,
    value-key: int or string,
    error-key: none or int or string or array,
    mode: string,
    size: array,
    bar-style: style or function,
    x-label: content or none,
    x-format,
    y-label: content or none,
    labels: none or content,
    ..plot-args: any
)
```

### **data**    array

Array of data rows. A row can be of type array or dictionary, with `label-key` and `value-key` being the keys to access a rows label and value(s).

## Example

```
(([A], 1), ([B], 2), ([C], 3),)
```

### **label-key**    int or string

Key to access the label of a data row. This key is used as argument to the rows `.at(..)` function.

Default: 0

### **value-key**    int or string

Key(s) to access values of a data row. These keys are used as argument to the rows `.at(..)` function.

Default: 1

### **error-key**    none or int or string or array

Key(s) to access error values of a data row. These keys are used as argument to the rows `.at(..)` function.

Default: none

**mode** `string`

Chart mode:

- basic** Single bar per data row
- clustered** Group of bars per data row
- stacked** Stacked bars per data row
- stacked100** Stacked bars per data row relative to the sum of the row

Default: "basic"

**size** `array`

Chart size as width and height tuple in canvas unist; width can be set to auto.

Default: (auto, 1)

**bar-style** `style` or `function`

Style or function (idx => style) to use for each bar, accepts a palette function.

Default: palette.red

**x-label** `content` or `none`

x axis label

Default: none

**y-label** `content` or `none`

Y axis label

Default: none

**labels** `none` or `content`

Legend labels per x value group

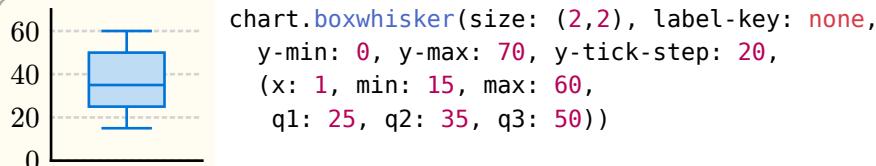

Default: none

**..plot-args** `any`

Arguments to pass to `plot.plot`

**7.0.1 boxwhisker**

Add one or more box or whisker plots.

## 8 Styling

**Root boxwhisker**

**box-width:** float

Default: 0.75

The width of the box. Since boxes are placed 1 unit next to each other, a width of 1 would make neighbouring boxes touch.

**whisker-width:** float

Default: 0.5

The width of the whisker, that is the horizontal bar on the top and bottom of the box.

**mark-size:** float

Default: 0.15

The scaling of the mark for the boxes outlier values in canvas units.

You can use any plot or axes related style keys, too.

### Parameters

```
boxwhisker(
  data: array|dictionary,
  size,
  label-key: integer|string,
  mark: string,
  ..plot-args: any
)
```

**data** array or dictionary

Dictionary or array of dictionaries containing the needed entries to plot box and whisker plot.

See `plot.add-boxwhisker` for more details.

### Examples:

- `(x: 1, outliers: (7, 65, 69), min: 15, max: 60, q1: 25, q2: 35, q3: 50)` // Location on x-axis, Optional outliers, Minimum and maximum, Quartiles: Lower, Median, Upper
- `size (array)` : Size of chart. If the second entry is auto, it automatically scales to accommodate the number of entries plotted

**label-key** integer or string

Index in the array where labels of each entry is stored

Default: 0

**mark** string

Mark to use for plotting outliers. Set none to disable. Defaults to “x”

Default: “\*”

**..plot-args** any

Additional arguments are passed to `plot.plot`

**8.0.1 columnchart**

Draw a column chart. A column chart is a chart that represents data with rectangular bars that grow from bottom to top, proportional to the values they represent.

## 9 Styling

**Root:** `columnchart`.

**bar-width:** float

Default: 0.8

Width of a single bar (basic) or a cluster of bars (clustered) in the plot.

**x-inset:** float

Default: 1

Distance of the plot data to the plot’s edges on the x-axis of the plot.

You can use any `plot` or `axes` related style keys, too.

The `columnchart` function is a wrapper of the `plot` API. Arguments passed to `..plot-args` are passed to the `plot.plot` function.

**Parameters**

```
columnchart(
  data: array,
  label-key: int string,
  value-key: int string,
  error-key: none int string array,
  mode: string,
  size: array,
  bar-style: style function,
  x-label: content none,
  y-format,
  y-label: content none,
  labels: none content,
  ..plot-args: any
)
```

**data** array

Array of data rows. A row can be of type array or dictionary, with `label-key` and `value-key` being the keys to access a rows label and value(s).

**Example**

```
(([A], 1), ([B], 2), ([C], 3),)
```

**label-key** `int` or `string`

Key to access the label of a data row. This key is used as argument to the rows `.at(..)` function.

Default: `0`

**value-key** `int` or `string`

Key(s) to access value(s) of data row. These keys are used as argument to the rows `.at(..)` function.

Default: `1`

**error-key** `none` or `int` or `string` or `array`

Key(s) to access error values of a data row. These keys are used as argument to the rows `.at(..)` function.

Default: `none`

**mode** `string`

Chart mode:

**basic** Single bar per data row

**clustered** Group of bars per data row

**stacked** Stacked bars per data row

**stacked100** Stacked bars per data row relative to the sum of the row

Default: `"basic"`

**size** `array`

Chart size as width and height tuple in canvas unist; width can be set to auto.

Default: `(auto, 1)`

**bar-style** `style` or `function`

Style or function (idx => style) to use for each bar, accepts a palette function.

Default: `palette.red`

**x-label** `content` or `none`

x axis label

Default: `none`

**y-label** `content` or `none`

Y axis label

Default: `none`

**labels** `none` or `content`

Legend labels per y value group

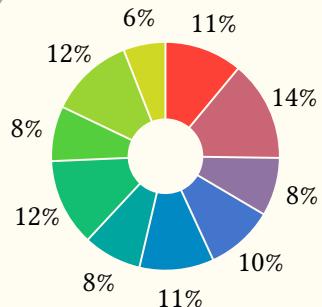

Default: `none`

**..plot-args** `any`

Arguments to pass to `plot.plot`

## 9.0.1 piechart

Draw a pie- or donut-chart

```
let data = (24, 31, 18, 21, 23, 18, 27, 17, 26, 13)
let colors = gradient.linear(red, blue, green, yellow)

chart.piechart(
  data,
  radius: 1.5,
  slice-style: colors,
  inner-radius: .5,
  outer-label: (content: "%",))
```

## 10 Styling

**Root** piechart

**radius:** `number`

Default: `1`

Outer radius of the chart.

**inner-radius:** `number`

Default: `0`

Inner radius of the chart slices. If greater than zero, the chart becomes a “donut-chart”.

**gap:** `number` or `angle`

Default: `0.5deg`

Gap between chart slices to leave empty. This does not increase the charts radius by pushing slices outwards, but instead shrinks the slice. Big values can result in slices becoming invisible if no space is left.

**outset-offset:** `number` or `ratio`

Default: `10%`

Absolute, or radius relative distance to push slices marked for “outsetting” outwards from the center of the chart.

**outset-offset:** `string`

Default: `"OFFSET"`

The mode of how to perform “outsetting” of slices:

- “OFFSET”: Offset slice position by `outset-offset`, increasing their gap to their siblings

- “RADIUS”: Offset slice radius by `outset-offset`, which scales the slice and leaves the gap unchanged

**start:** `angle` Default: `90deg`

The pie-charts start angle (ccw). You can use this to draw charts not forming a full circle.

**stop:** `angle` Default: `450deg`

The pie-charts stop angle (ccw).

**clockwise:** `bool` Default: `true`

The pie-charts rotation direction.

**outer-label.content:** `none` or `string` or `function` Default: `"LABEL"`

Content to display outsides the charts slices. There are the following predefined values:

**LABEL** Display the slices label (see `label-key`)

**%** Display the percentage of the items value in relation to the sum of all values, rounded to the next integer

**VALUE** Display the slices value

If passed a `<function>` of the format `(value, label) => content`, that function gets called with each slices value and label and must return content, that gets displayed.

**outer-label.radius:** `number` or `ratio` Default: `125%`

Absolute, or radius relative distance from the charts center to position outer labels at.

**outer-label.angle:** `angle` or `auto` Default: `0deg`

The angle of the outer label. If passed `auto`, the label gets rotated, so that the baseline is parallel to the slices secant.

**outer-label.anchor:** `string` Default: `"center"`

The anchor of the outer label to use for positioning.

**inner-label.content:** `none` or `string` or `function` Default: `none`

Content to display insides the charts slices. See `outer-label.content` for the possible values.

**inner-label.radius:** `number` or `ratio` Default: `150%`

Distance of the inner label to the charts center. If passed a `<ratio>`, that ratio is relative to the mid between the inner and outer radius (`inner-radius` and `radius`) of the chart

**inner-label.angle:** `angle` or `auto` Default: `0deg`

See `outer-label.angle`.

**inner-label.anchor:** `string` Default: `"center"`

See `outer-label.anchor`.

**legend.label:** `none` or `string` or `function` Default: `"LABEL"`

See `outer-label.content`. The legend gets shown if this key is set != `none`.

## 11 Anchors

The chart places one anchor per item at the radius of it's slice that gets named `"item-<index>"` (outer radius) and `"item-<index>-inner"` (inner radius), where index is the index of the sclice data in `data`.

## Parameters

```
piechart(
  data: array,
  value-key: none int string,
  label-key: none int string,
  outset-key: none int string,
  outset: none int array,
  slice-style: function array gradient,
  name,
  ..style
)
```

### **data** array

Array of data items. A data item can be:

- A number: A number that is used as the fraction of the slice
- An array: An array which is read depending on value-key, label-key and outset-key
- A dictionary: A dictionary which is read depending on value-key, label-key and outset-key

### **value-key** none or int or string

Key of the “value” of a data item. If for example data items are passed as dictionaries, the value-key is the key of the dictionary to access the items chart value.

Default: none

### **label-key** none or int or string

Same as the value-key but for getting an items label content.

Default: none

### **outset-key** none or int or string

Same as the value-key but for getting if an item should get outset (highlighted). The outset can be a bool, float or ratio. If of type bool, the outset distance from the style gets used.

Default: none

### **outset** none or int or array

A single or multiple indices of items that should get offset from the center to the outsides of the chart. Only used if outset-key is none!

Default: none

**slice-style** `function` or `array` or `gradient`

Slice style of the following types:

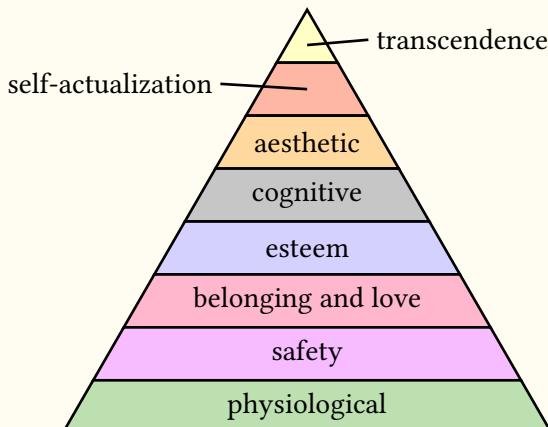

- function: A function of the form `index => style` that must return a style dictionary. This can be a palette function.
- array: An array of style dictionaries or fill colors of at least one item. For each slice the style at the slices index modulo the arrays length gets used.
- gradient: A gradient that gets sampled for each data item using the the slices index divided by the number of slices as position on the gradient.

If one of stroke or fill is not in the style dictionary, it is taken from the charts style.

Default: `palette.red`

**11.0.1 pyramid**

Draw a pyramid chart

```
let data = (
  "transcendence",
  "self-actualization",
  "aesthetic",
  "cognitive",
  "esteem",
  "belonging and love",
  "safety",
  "physiological"
)
let colors = (
  rgb("#FFFFC5"), rgb("#FEB6A5"),
  rgb("#FFD89F"), rgb("#C6C6C6"),
  rgb("#D4D1FF"), rgb("#FFB7CD"),
  rgb("#F7BCFF"), rgb("#BDE0B0"),
)
chart.pyramid(
  data,
  level-style: colors,
  level-height: 0.7)
```

**12 Styling**

**Root pyramid**

**level-height:** `number`

Default: `1`

Minimum level height.

**gap:** `number` or `ratio`

Default: `0`

Gap between levels to leave empty. If mode is “AREA-HEIGHT”, the value must be a ratio and will be proportional to the height of the first level.

**mode:** `string`

Default: `"REGULAR"`

The mode of how to shape each level:

- “REGULAR”: All levels have the same height and make a perfectly triangular pyramid

- “AREA-HEIGHT”: The area of each level is proportional to its value. Only the height is adapted, keeping the pyramid triangular
- “HEIGHT”: The height of each level is proportional to its value. The pyramid is kept as a perfect triangle
- “WIDTH”: The height of each level is fixed, but its width is proportional to the value. The pyramid might not be perfectly triangular

**side-label.content:** `none` or `string` or `function`

Default: `none`

Content to display outsides the charts levels, on the side. There are the following predefined values:

**LABEL** Display the levels label (see `label-key`)

**%** Display the percentage of the items value in relation to the sum of all values, rounded to the next integer

**VALUE** Display the levels value

If passed a `<function>` of the format `(value, label) => content`, that function gets called with each levels value and label and must return content, that gets displayed.

**side-label.side:** `string`

Default: `"west"`

The side of the chart on which to place side labels, either “west” or “east”

**inner-label.content:** `none` or `string` or `function`

Default: `"LABEL"`

Content to display insides the charts levels. See `side-label.content` for the possible values.

**inner-label.force-inside:** `boolean`

Default: `false`

If false, labels are automatically placed outside their correspoding levels if they don’t fit inside. If true, they are always placed inside.

## 13 Anchors

The chart places one anchor per item at the center of its level that gets named `"levels.<index>"`, one on the middle of its left side named `"levels.<index>.west"`, and one on the right side named `"levels.<index>.east"`, where index is the index of the level data in `data`.

### Parameters

```
pyramid(
  data: array,
  value-key: none int string,
  label-key: none int string,
  level-style: function array gradient,
  name,
  ..style
)
```

**data** `array`

Array of data items. A data item can be:

- A number: A number that is used as the fraction of the level
- An array: An array which is read depending on `value-key` and `label-key`
- A dictionary: A dictionary which is read depending on `value-key` and `label-key`

**value-key**    `none` or `int` or `string`

Key of the “value” of a data item. If for example data items are passed as dictionaries, the value-key is the key of the dictionary to access the items chart value.

Default: `none`

**label-key**    `none` or `int` or `string`

Same as the value-key but for getting an items label content.

Default: `none`

**level-style**    `function` or `array` or `gradient`

Level style of the following types:

- function: A function of the form `index => style` that must return a style dictionary. This can be a palette function.
- array: An array of style dictionaries or fill colors of at least one item. For each level the style at the levels index modulo the arrays length gets used.
- gradient: A gradient that gets sampled for each data item using the the levels index divided by the number of levels as position on the gradient.

If one of stroke or fill is not in the style dictionary, it is taken from the charts style.

Default: `palette.red`
